

COPPER STAVES WEAR-RESISTANT TECHNOLOGY

As furnace operators strive to achieve higher productivities and longer campaigns, copper staves must cope with ever more challenging conditions, particularly against excessive wear (abrasion on the hot face).

Wear-resistant copper staves from Primetals Technologies self-protect against excessive abrasion, ensuring extended campaigns regardless of operating and burden conditions.

STAVE WEAR

Copper stave wear is a phenomenon experienced by many blast furnace operators globally. The wear is caused by relatively cold, abrasive materials being present at the furnace walls, together with excessive forces from the descending burden.

The correct furnace internal profile is important to avoid this problem as an incorrect profile can contribute to excessive wear. Other events such as furnace process disturbances, changes in position of the cohesive zone, high rates of reductant injection, errors in furnace charging patterns and poor burden quality can also contribute to the occurrence of wear.

Excessive stave wear can lead to exposure of the stave cooling water channels, leading to water leaks into the furnace, followed by the loss of staves. Without significant and costly intervention this can ultimately lead to furnace shell damage.

WEAR-RESISTANT TECHNOLOGY

The wear-resistant copper staves from Primetals Technologies is patent pending. It incorporates cast iron hexagonal inserts which protrude beyond the hot face of the copper stave body that serves two functions:

- To create a “stone box” effect trapping in the unreduced materials when they are present
- To create a surface that encourages an accretion layer when liquidous materials are present that reforms during process excursions, self-protecting against wear

Wear-resistant copper staves with pocket type hexagonal inserts

BEND-RESISTANT TECHNOLOGY

Copper staves from Primetals Technologies also feature as standard the patented anti-bending solution which prevents premature failure of the staves by allowing the cooling water pipes to move during thermal expansion but prevents any bending of the stave corners from occurring.

PRIMETALS TECHNOLOGIES STAVES PORTFOLIO

As a leading supplier of blast furnace staves for over 40 years, Primetals Technologies knows that optimum furnace cooling design starts with understanding the profile of the furnace and the process conditions.

With such know-how Primetals Technologies optimizes furnace stave design to best match the varying conditions within the furnace, resulting in long-life, trouble-free operation.

BENEFITS

- Hexagonal inserts provide a “3-point lock” mechanism which retains the burden material between inserts
- Hexagonal inserts provide additional stiffness, further minimizing stave bending
- Standard and retro-fit solutions for new furnaces and furnace relines, with minimal installation and downtime requirements
- Significant reduction in wear and unplanned maintenance – long campaign lifetime
